Notes

Where a cavity is formed and Cavity Wall Ties are required, Newton Helifix ties should be driven into the Newton MultiPlug, using the appropriate Newton helifix Application tool, ready for insertion into the mortar joint of the block or brick wall.

BS 5628 states that the depth of embedment into the near leaf mortar joint should be a minimum of 50mm. However for additional security in order to mitigate any installation inaccuracies Helifix advise $\frac{3}{4}$ of the near leaf thickness (minimum of 70mm) 28mm of the tie is inserted into the Newton MultiPlug.

The spacing of the ties is dependent on the wall thickness and the width of the cavity - see table above the drawing. Ties at vertical edges of openings or unbonded edges, ie: movement joints, should be placed at 300mm centres vertically at a maximum 225mm from the open edge.

Newton Insulation Clips should be used to hold the insulation in place. Depending on the position of he insulation one or two clips will be required per tie.

Newton MultiPlug Helifix Ties are 6mm in diameter and are available in lengths of 155, 170, 195, 220, 245, 270, 295 and 325mm.
